

1. A method of receiving a digital signal comprising the steps of:

receiving a plurality of programs and program information of the plurality of programs;

selecting a program from the plurality of programs which are received;

forming new program information of the selected program including at least a time of program reception;

outputting the selected program and the new program information to a recording media;

inputting the new program information reproduced from the recording media;

comparing the time of program reception contained in the reproduced new program information with the current time; and

inputting the selected program reproduced from the recording media if the comparison satisfies predetermined condition and inhibiting inputting of the selected program from the recording media if the comparison does not satisfy a predetermined condition.
